

# Practice: File I/O, Structures, Union, and Abstract Data Types

---

# FILE I/O

---

- `fopen`, `fclose`
- `fgetc`, `fscanf`, `fgets`, `fread`...
- `fputc`, `fprintf`, `fputs`, `fwrite`...
- Google is your friend!

```
#include <stdio.h>

void swap1(char s1, char s2);
void swap2(char * s1, char * s2);
void swap3(char ** s1, char ** s2);

int main(void)
{
    FILE * f1;
    FILE * f2;
    char tmp;
    char buffer[1024];

    f1 = fopen("input.txt", "r");
    f2 = fopen("output.txt", "w");

    printf("%c\n", fgetc(f1));
    fprintf(stdout, "%c\n", fgetc(f1));
    fprintf(f2, "%c\n", fgetc(f1));

    scanf("%c", & tmp);
    printf("%c\n", tmp);
    fscanf(stdin, "%s", buffer);
    printf("%s\n", buffer);

    fscanf(f1, "%c", &tmp);
    printf("%c\n", tmp);

    fgets(buffer, 1024, f1);
    printf("%s", buffer); // be aware of \n character!

    fscanf(f1, "%s", buffer);
    printf("%s", buffer);
    printf("End! \n");
}
```

# FILE I/O

---

```
dccp_ta@sysprog1:~> cat input.txt
abcdefg
hijklmnop
qrstuvwxyz
dccp_ta@sysprog1:~> !./
./a.out
a
b
12345
1
2345
d
efg
hijklmnopEnd!
dccp_ta@sysprog1:~> cat output.txt
c
dccp_ta@sysprog1:~> █
```

# Structure

- Struct person introduces a structure which contains three members, i.e., name, age, and gender

```
#include <stdio.h>

struct person {
    char name[10];
    int age;
    char gender;
};

int main()
{
    struct person per1 = {"Lee", 20, 'f'};
    struct person per2;
    struct person *pp;

    printf("%s, %d, %c\n", per1.name,
           per1.age, per1.gender);
    per1.age = 10;
```

```
    per2 = per1;
    printf("%s, %d, %c\n", per2.name,
           per2.age, per2.gender);

    pp = &per1;
    (*pp).age = 30;
    pp->gender = 'm';
    printf("%s, %d, %c\n", pp->name,
           pp->age, pp->gender);

    return 0;
}
```

# Structure (contd.)

---

A screenshot of a PuTTY terminal window titled "sysprog1.snu.ac.kr - PuTTY". The terminal shows a user named "dccp\_ta" at the "sysprog1" host, in the directory "~/practice10". The user has compiled a C program "ex1.c" into "ex1" using "gcc -o ex1 ex1.c". They then executed the program with "./ex1", which printed three lines of output: "Lee, 20, f", "Lee, 10, f", and "Lee, 30, m". The terminal is currently at the prompt "dccp\_ta@sysprog1:~/practice10>" with a green cursor.

```
sysprog1.snu.ac.kr - PuTTY
dccp_ta@sysprog1:~/practice10> gcc -o ex1 ex1.c
dccp_ta@sysprog1:~/practice10> ./ex1
Lee, 20, f
Lee, 10, f
Lee, 30, m
dccp_ta@sysprog1:~/practice10> █
```

# Union

- members share storage

```
typedef union foo {
    int n;
    float r;
} number;

int main(void)
{
    number m;
    m.n = 2345;
    printf("n: %10d    r: %16.10e\n", m.n, m.r);
    m.r = 2.345;
    printf("n: %10d    r: %16.10e\n", m.n, m.r);
    return 0;
}
```

# ADT: Linked Lists

- A list of elements  $a_1, a_2, \dots, a_k$
- Each node contains a reference to the next node in the sequence
- What is the benefit of a linked list over an array?

# ADT: Linked Lists (contd.)

- A node of a linked list is implemented with a structure
- It has two members: element and next
  - Next is a pointer to struct node

```
#include <stdio.h>
#include <stdlib.h>

struct node {
    int element;
    struct node *next;
};
```

# ADT: Linked Lists (contd.)

- `Linsert(list, x)` gets `list`, which is a pointer to a linked list, and `x` as its input
  - It inserts `x` at the front of the list

```
struct node *Linsert(struct node *list,
                    int x)
{
    struct node *pnew;
    pnew = malloc(sizeof(struct node));
    if (pnew == NULL) {
        printf("malloc error\n");
        return NULL;
    }
    pnew->element = x;
    pnew->next = list;
    return pnew;
}
```

e.g. `list = Linsert(list, 10)`

# ADT: Linked Lists (contd.)

- Lremove(list) also gets list, which is a pointer to a linked list as its input
  - It removes the first element from the list

```
struct node *Lremove(struct node *list)
{
    struct node *pNext;
    if (list == NULL) {
        printf("list is empty");
        return list;
    }
    pNext = list->next;
    free(list);
    return pNext;
}
```

e.g. list = Lremove(list)

# ADT: Linked Lists (contd.)

- Lsearch(list, x) gets list and x as its input
  - If x is in the list, it returns the pointer of the node that contains x; NULL otherwise
- PrintList prints all elements in the list

```
struct node *Lsearch(  
    struct node *list, int x)  
{  
    struct node *pn;  
    for (pn = list;  
        pn != NULL;  
        pn = pn->next)  
        if (pn->element == x) return pn;  
    return NULL;  
}
```

```
void PrintList(struct node *list)  
{  
    if (list == NULL) {  
        printf("\n");  
        return;  
    }  
    printf("%d ", list->element);  
    PrintList(list->next);  
}
```

# ADT: Linked Lists (contd.)

- A program that creates a linked list by inserting elements, and searches it for an element x

```
int main()
{
    struct node *list = NULL;
    int x;

    while (1) {
        printf("enter x (0 to terminate): ");
        scanf("%d", &x);
        if (x == 0) break;
        list = Linsert(list, x);
    }
    PrintList(list);
}
```

```
printf("enter x: ");
scanf("%d", &x);

if (Lsearch(list, x) != NULL)
    printf("%d is in the list\n", x);
else
    printf("%d is not in the list\n", x);

while (list != NULL) {
    list = Lremove(list);
    PrintList(list);
}

return 0;
}
```

# ADT: Linked Lists (contd.)

```
sysprog1.snu.ac.kr - PuTTY
dccp_ta@sysprog1:~/practice10> gcc -o ex2 ex2.c
dccp_ta@sysprog1:~/practice10> ./ex2
enter x (0 to terminate): 1
enter x (0 to terminate): 3
enter x (0 to terminate): 5
enter x (0 to terminate): 7
enter x (0 to terminate): 9
enter x (0 to terminate): 0
9 7 5 3 1
enter x: 8
8 is not in the list
7 5 3 1
5 3 1
3 1
1
dccp_ta@sysprog1:~/practice10>
```

# ADT: Stack

---

- A list of elements  $a_1, a_2, \dots, a_k$
- Elements are inserted and deleted only at one place called the top

```
#include <stdio.h>
#define MAX 100

struct stack {
    int starray[MAX] ;
    int top;
};
```

# ADT: Stack (contd.)

---

```
struct stack *create(void)
{
    struct stack *st;

    st = malloc(sizeof(struct stack));
    if (st == NULL) {
        printf("malloc error\n");
        return NULL;
    }
    st->top = 0;
    return st;
}
```

# ADT: Stack (contd.)

---

```
int is_empty(struct stack *st)
{
    return st->top == 0;
}

void push(struct stack *st, int x)
{
    if (st->top == MAX) {
        printf("stack is full\n");
        return;
    }
    st->starray[st->top++] = x;
}
```

# ADT: Stack (contd.)

---

```
int pop(struct stack *st)
{
    if (is_empty(st)) {
        printf("stack is empty\n");
        return;
    }

    return st->starray[--st->top];
}
```

# ADT: Stack (contd.)

```
int main(void)
{
    struct stack *st;
    int x;

    st = create();
    while (1) {
        printf("enter x (0 to terminate): ");
        scanf("%d", &x);
        if (x == 0) break;
        push(st, x);
    }
    while (!is_empty(st))
        printf("%d ", pop(st));
    printf("\n");

    return 0;
}
```

# Exercise

---

# Exercise 1

---

- Write a program that reads a file and removes all the whitespace characters
  - input.txt, output.txt

## Exercise 2

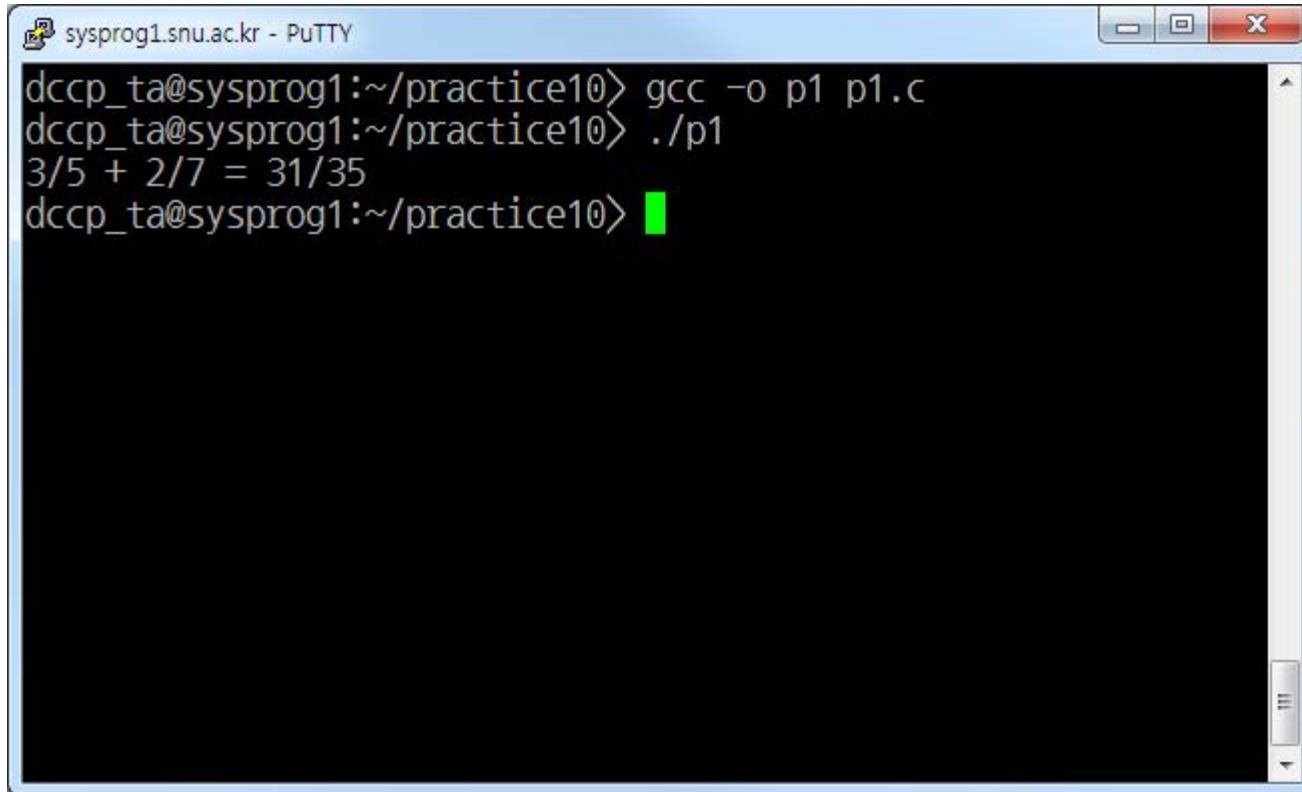

---

- 1. Declare a structure for fraction numbers
- 2. Write a function fracsum(a, b) for fraction number addition

```
struct fraction a = {3, 5}, b = {2, 7};  
struct fraction c;  
  
c = fracsum(a, b);  
  
printf("%d/%d + %d/%d = %d/%d\n", a.num,  
    a.denom, b.num, b.denom, c.num, c.denom);
```

## Exercise 2 (contd.)

---

A screenshot of a PuTTY terminal window titled "sysprog1.snu.ac.kr - PuTTY". The terminal shows the following commands and output:

```
dccp_ta@sysprog1:~/practice10> gcc -o p1 p1.c
dccp_ta@sysprog1:~/practice10> ./p1
3/5 + 2/7 = 31/35
dccp_ta@sysprog1:~/practice10> █
```

The output of the program is the fraction  $3/5 + 2/7 = 31/35$ . A green cursor is visible on the line following the prompt.

## Exercise 3

---

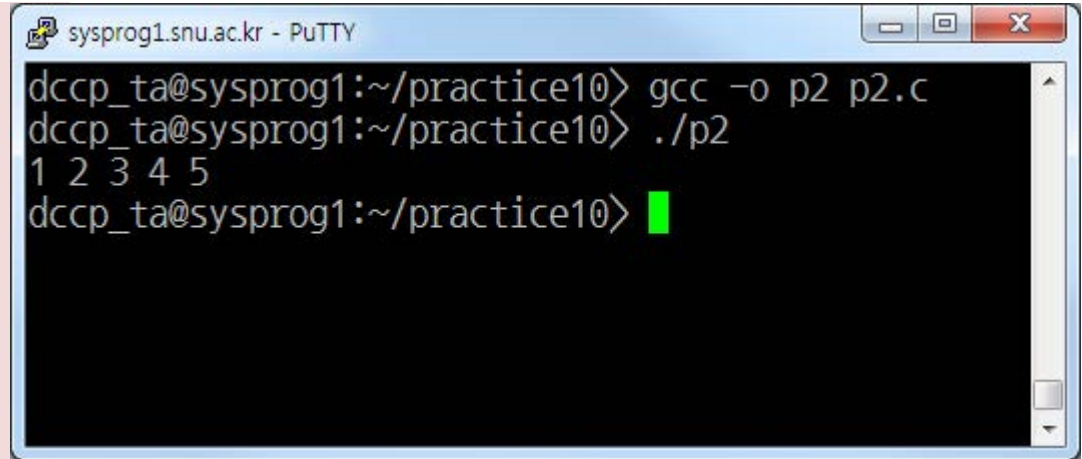

- Write the following linked list operations
  - `struct node *Lappend(struct node *list1, struct node *list2)`
    - Appends list2 at the end of list1
    - Be careful that list1 may be NULL

# Exercise 3 (contd.)

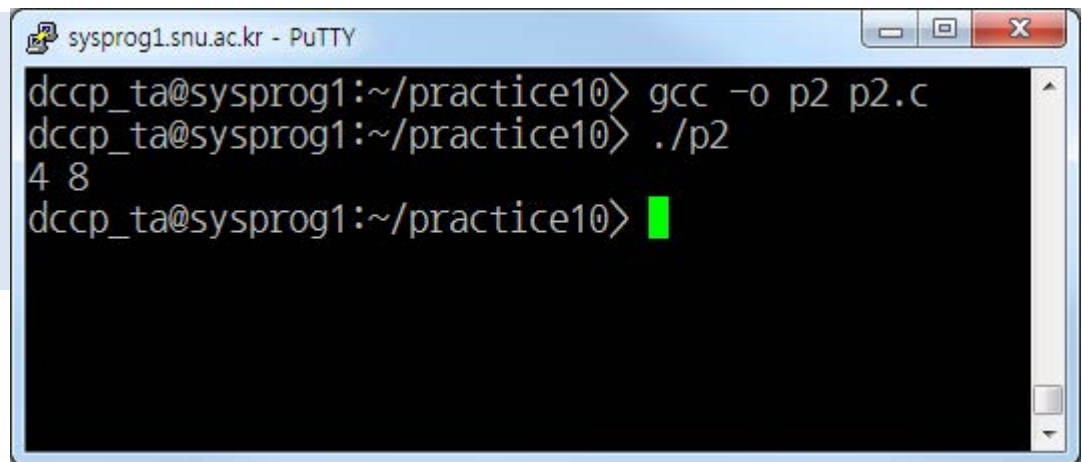

```
struct node *list1 = NULL;
struct node *list2 = NULL;
struct node *list3;

list1 = Linsert(list1, 3);
list1 = Linsert(list1, 2);
list1 = Linsert(list1, 1);
list2 = Linsert(list2, 5);
list2 = Linsert(list2, 4);
list3 = Lappend(list1, list2);
PrintList(list3);
```

```
sysprog1.snu.ac.kr - PuTTY
dccp_ta@sysprog1:~/practice10> gcc -o p2 p2.c
dccp_ta@sysprog1:~/practice10> ./p2
1 2 3 4 5
dccp_ta@sysprog1:~/practice10>
```

```
struct node *list = NULL;
list = Linsert(list, 8);
list = Linsert(list, 4);
list = Lappend(NULL, list);
PrintList(list);
```

```
sysprog1.snu.ac.kr - PuTTY
dccp_ta@sysprog1:~/practice10> gcc -o p2 p2.c
dccp_ta@sysprog1:~/practice10> ./p2
4 8
dccp_ta@sysprog1:~/practice10>
```
